

CMS / Framework Installation Version 3.1.2

Thanks for choosing to use SilverStripe! Please follow the instructions below and you should be up in running in no time. If you get stuck, head over to the [installation forum](#), or check out our list of [suggested web hosts](#) known to work with SilverStripe.

There are some issues that we recommend you look at before installing, however, you are still able to install the software. Please see below for details. If you are having problems meeting the requirements, see the [server requirements](#).

Please [enter an email address and password](#) for the default administrator account before installing.

Requirements Step 1 of 5

PHP Configuration <small>All Requirements Pass but 4 Warnings</small> Show All Requirements	
fileinfo support	fileinfo should be enabled in PHP. SilverStripe uses it for MIME type detection of files. SilverStripe will still operate, but email attachments and sending files to browser (e.g. export data to CSV) may not work correctly without finfo.
curl support	curl should be enabled in PHP. SilverStripe uses it for consuming web services via the RestfulService class and many modules rely on it.
tidy support	Tidy provides a library of code to clean up your html. SilverStripe will operate fine without tidy but HTMLCleaner will not be effective.
display_errors option	display_errors is set to '1' in php.ini. Unless you're in a development environment, this should be turned off, as it can expose sensitive data to website users.
File permissions <small>All Requirements Pass</small> Show All Requirements	
Webserver Configuration <small>All Requirements Pass but 1 Warning</small> Show All Requirements	
URL rewriting support	You need mod_rewrite to use friendly URLs with SilverStripe, but it is not enabled.
Database Configuration <small>All Requirements Pass</small> Show All Requirements	

Re-check requirements

Read more about our [server requirements](#).

Database Configuration Step 2 of 5

MySQL 5.0+

Database server:

Database username:

Database password:

Database name:

SilverStripe stores its content in a relational SQL database. Please provide the username and password to connect to the server here. If this account has permission to create databases, then we will create the database for you; otherwise, you must give the name of a database that already exists.

Other databases:

Databases in the list that are greyed out cannot currently be used. Click on them for more information and possible remedies.

- SQL Server 2008
- PostgreSQL 8.3+
- SQLite 3.3+

Re-check requirements

CMS Admin Account Step 3 of 5

Email:

Password:

Default language:

We will set up the first administrator account for you automatically. You can change these details later in the "Security" section within the CMS.

"Default language" determines the default locale settings (for dates, currencies, etc.), as well as the default language of the CMS interface. This can be changed for each user.

Warning: The CMS interface may be missing translations in certain locales.

Theme selection Step 4 of 5

- [Simple](#) - our default theme ready to use, or begin the [tutorial](#).
- Empty template

You can change the theme or [download](#) another from the SilverStripe website after installation.

Confirm Install Step 5 of 5

- Send information about my webserver to [silverstripe.org](#)
(anonymous version information, used for statistical purposes)
