SilverStripe CMS Installation
Version 2.3.3

Welcome to SilverStripe

Thanks for choosing to use SilverStripe! Please follow the instructions below to get SilverStripe installed.

There are some issues that we recommend you look at before installing, however, you are still able to install the software. Please see below for details.
If you are having problems meeting the requirements, see the server requirements wiki page.

Template to install:

BlackCandy, default template ready to use.

Empty template, ready to begin the tutorial.

You can change the template or download another from the SilverStripe website after installation.

Send information on my webserver to SilverStripe (this is only version information, used for statistical purposes)

MySQL Database

These database details look all good!

MySQL server:

MySQL username:

MySQL password:

MySQL database:

SilverStripe stores its content in a MySQL database. Please provide the username and password to connect to the server here. If this account has permission to create databases, then we will create the database for you; otherwise, you must give the name of a database that already exists.

Details

Does the server exist	OK (localhost)
Are the access credentials correct	OK
MySQL version at least 4.1	OK (MySQL 5.1.43-community)
Can I access/create the database	OK (Able to create a new database)

SilverStripe Administration Account

Administrator email:

We will set up 1 administrator account for you automatically. Enter the email address and password. If you'd rather log-in with a username instead of an email address, enter that instead.

Administrator password:

Administrator first name:

Administrator surname:

Development Servers

Development servers:

SilverStripe allows you to run a site in development mode. This shows all error messages in the web browser instead of emailing them to the administrator, and allows the database to be built without logging in as administrator. Please enter the host/domain names for servers you will be using for development.

Requirements

PHP Configuration

PHP5 installed	OK (PHP version 5.2.12)
GD2 support	OK
XML support	OK
MySQL support	OK
Memory allocated (PHP config option 'memory_limit')	OK (128M)
Check that certain classes haven't been defined by PHP plugins	OK

File permissions

Does the webserver know where files are stored?	OK (E:\websites_SilverStrip\www\)
mysite/ folder exists	OK
sapphire/ folder exists	OK
cms/ folder exists	OK
jsparty/ folder exists	OK
Is the .htaccess file writeable?	OK
Is the mysite/_config.php file writeable?	OK
Is the assets/ folder writeable?	OK
Is the temporary folder writeable?	OK

Webserver Configuration

Server software	I can't tell what webserver you are running. Without Apache I

SilverStripe CMS Installation

	can't tell if mod_rewrite is enabled.
mod_rewrite enabled	I can't tell whether mod_rewrite is running. You may need to configure a rewriting rule yourself.
